Hackathon demo

Spectrum

Google Analytics for the human side of AI conversations

We turn a 30-minute AI call into emotional, behavioral, and decision-ready insights.

Confidence | Hesitation | Readiness | Friction

Single-Call Voice Analytics Workbench

Readable 30-minute example with full-width waveform, background-noise detection, and emoji-based raw emotion highlights.

Example Call: AI Product Discovery Call • 30m 12s • Human Speaker Focus

Call Player

Emotion-Aware 30-Minute Waveform

The waveform spans the full 30-minute call. Human-speaking segments are color-coded by emotion cluster. The heatband below helps analysts scan the entire emotional journey quickly.

Duration

30:12

Transcript confidence

AI + Human

PROBLEM

Transcripts tell you what was said. They miss how the human actually felt.

Analysts review AI calls still have to guess where confidence rose, hesitation spiked, or the conversation went off track.

Long calls are slow to review

A 30-minute call still means replaying audio, skimming text, and manually hunting for important moments.

Emotion and behavior get lost

Words alone do not show stress, doubt, engagement, pauses, fillers, or recovery after a tense turn.

Teams do not know what to do next

Without a clear signal, it is hard to decide whether to follow up, coach, escalate, or qualify the call.

The missing layer is human signal: emotion, hesitation, confidence, engagement, and readiness during the AI conversation.

GAP

Why transcripts fail for AI + human call review

A transcript is useful context, but it cannot show timing, emotion, or how the AI changed the human response.

Transcript view

"Yeah, I think this would actually help our onboarding team because right now everything is scattered across calls and notes."

You can read the sentence
You cannot see the confidence rise
You cannot see the pause before answering
You cannot see the AI calming effect

What analysts actually need

Where did hesitation spike?
When did confidence stabilize?
Did the AI reduce friction or create it?
Is the human moving toward a decision?
What should the team do after this call?

SOLUTION

Spectrum is a single-call voice analytics workbench

The product is built around one core question: how did the human sound, behave, and move toward or away from a decision during the AI conversation?

Single-Call Voice Analytics Workbench

Readable 30-minute example with full-width waveform, background-noise detection, and emoji-based raw emotion highlights.

Example Call: AI Product Discovery Call • 30m 12s • Human Speaker Focus

Call Player

Emotion-Aware 30-Minute Waveform

The waveform spans the full 30-minute call. Human-speaking segments are color-coded by emotion cluster. The heatband below helps analysts scan the entire emotional journey quickly.

Duration

Four job paths in one page

Investigate
Find the key moments and understand what happened.

Score
Measure confidence, hesitation, engagement, and readiness.

Coach
Spot struggle patterns and explain where the human got stuck.

Decide
Recommend follow-up, escalation, qualification, or risk review.

LIVE DEMO

The waveform becomes an analytics surface, not just a player

This is the strongest product moment in the demo because it shows emotion, timing, noise, and key moments on the same 30-minute view.

Readable 30-minute example with full-width waveform, background-noise de
raw emotion highlights.

Example Call: AI Product Discovery Call • 30m 12s • Human Speaker Focus

What to point at live

Full 30-minute waveform for fast scanning
Segment color overlay for emotion clusters
Heatband underneath for clean emotional comparison
Noise track for fan hum, typing, pings, or movement
Emoji raw emotion moments like 😰 😌 💪 😬

WORKFLOW

One call supports four analyst outcomes

Spectrum is not just an emotion viewer. It is a workbench that supports investigation, scoring, coaching, and decisioning from the same session.

Investigate

Jump to key moments like hesitation spikes, emotional recovery, or friction peaks.

Score

Generate human-focused metrics like confidence, engagement, hesitation, and readiness.

Coach

Explain where the human struggled, what improved mid-call, and where support is needed.

Decide

Recommend follow-up, escalation, qualification, or risk flagging based on the call.

Primary lens: evaluate the human. AI stays visible as context for interruptions, talk balance, timing, calming effect, and friction.

Why it matters

Spectrum turns AI conversations into someth teams can act on.

Sales teams can spot readiness.
Support teams can catch frustration.
AI teams can measure whether the agent builds trust or creates friction.

30 min	reviewed in seconds
4 jobs	investigate, score, coach, decide
1 page	human signal + AI context
